

What if...you decided to host a drone competition in your warehouse to generate additional interest in the sport and additional income for you? To please both the drone operators and the spectators, you planned a racing circuit that includes technical challenge and high speed. You included a vertical hairpin turn followed by a long straight line. And when you tested this arrangement, you were very pleased. The speed on the straight line seemed even more impressive because of the greater acceleration after the slower hairpin turn. Now you need to add the finishing touches. You plan to include neon props from floor to ceiling. Glowing shapes, lines and angles will be everywhere.
